

WRENCH, ADJUSTABLE WITH LOCKING PIN

BACKGROUND OF THE INVENTION

1. Field of the Invention

This invention relates in general to a wrench, and in particular, to a parallel, slidable jaw wrench used to tighten or loosen nuts, bolts, valve stems, or items requiring turning.

Adjustable wrenches have been used for many years and are still in use today. Most mechanics, machinist, millwrights, plumbers, and electricians have this wrench in their tool box.

The wrench in its present configuration is entirely suitable for casual use.. However, for extended use, doing a job repeatedly, a device for locking the adjustment would be desirable.

2. Description of Related Art

While making a patent search I have found a number of adjustable wrench patents with some form of locking device. Such as;

Keller U.S. Pat. No. 1,444,793, Swanstrom U.S. Pat. No. 2,849,908, Lindgran U.S. Pat. No. 3,857,308, Spector U.S. Pat. No. 5,222,419, Haskell U.S. Pat. No. 5,540,125, Gustafson U.S. Pat. No. 5,644,957.

None of these inventors use a locking method such as I have shown in this invention.

DESCRIPTION OF THE INVENTION

An adjustable wrench comprising a body having a handle, a fixed jaw (21), a moveable jaw (22) having a guiding flange and rack gear, a bore having a slot to accept the moveable jaw, a window (28) to accept a rotatable worm (23), a bore to accept a worm shaft (24), a bore (26) to accept a locking pin (25), a rotatable worm having threads to mate with said moveable jaw rack gear, a locking pin, said worm being held in said window by said worm shaft in worm shaft bore, and mating with said moveable jaw rack gear, said worm having one or more arrays of notches (27) milled across the circumference, said locking pin mating with one of said arrays of notches and aligning and entering said locking pin bore.

DESCRIPTION OF THE DRAWINGS

FIG. (1) is a plan view of the wrench showing the moveable jaw in the open position. The locking pin is shown in the inserted position.

FIG. (2) is a cross sectional view of the wrench showing the pin in the locking position.

FIG. (3) is an end view of the wrench showing the array of notches in the worm cooperating with the locking pin.
